4.3 Website Modules

The web application consists of:

1. User Module
2. Order Module
3. First Aid Module
4. Prescription module

4.3.1 User Module

Login Page

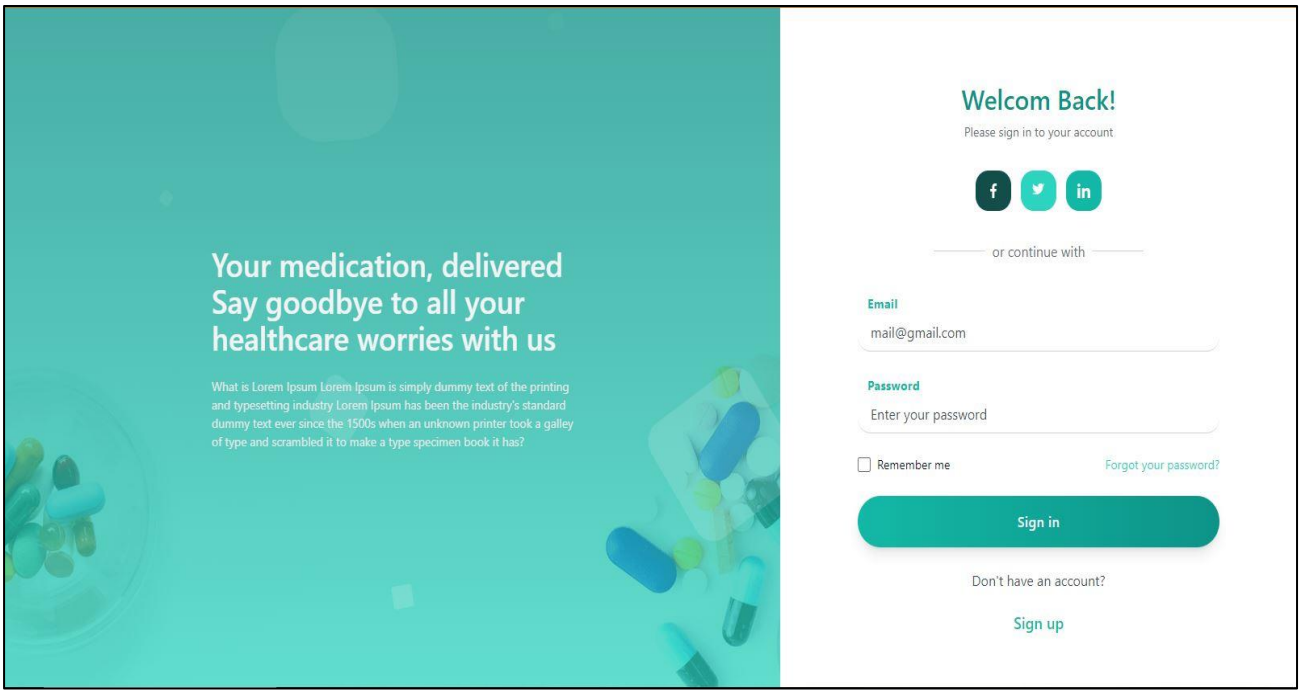

Figure 21: Login page

The traditional login method, user enter his email and password, the input data post to the server to validate them:

- If data is valid, then authenticate the user and redirect him back to his

profile page

- If not, view an error message to inform the user that "invalid email or password " and ask him to try again.

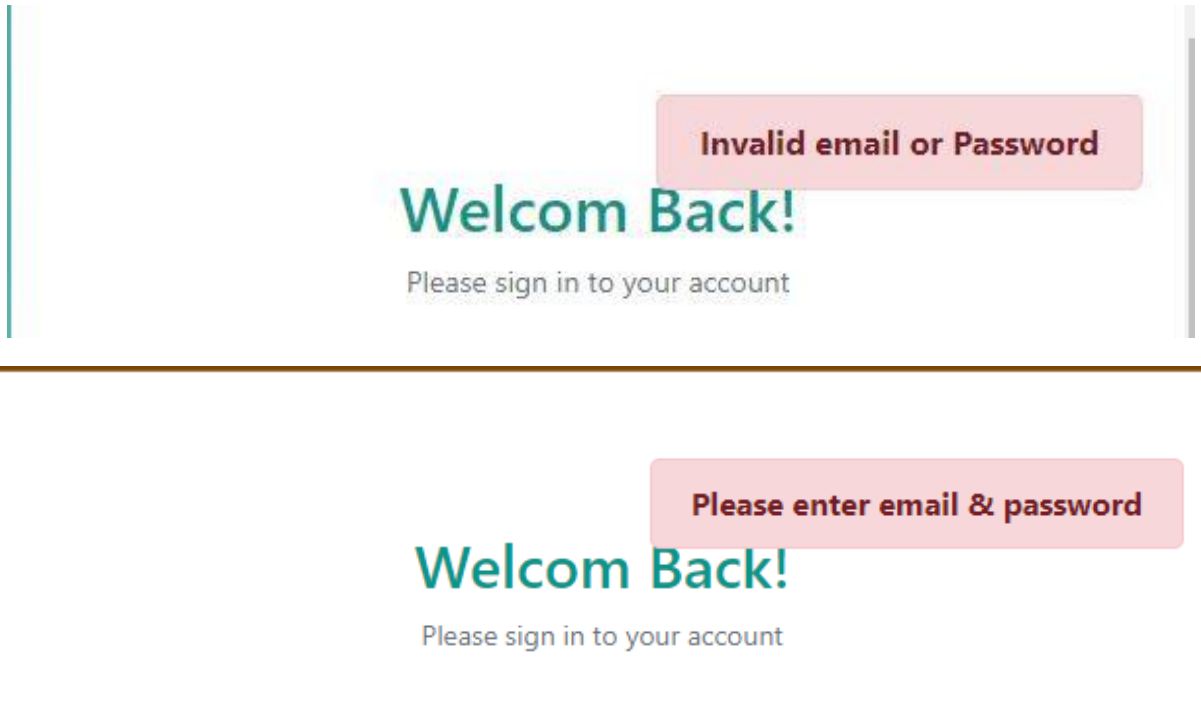

Figure 22: authentication page

JWT Authentication:

- A JWT is a mechanism to verify the owner of some JSON data. It's an encoded, URL-safe string that can contain an unlimited amount of data (unlike a cookie) and is cryptographically signed.
- When a server receives a JWT, it can guarantee the data it contains can be trusted because it's signed by the source. No middleman can modify a JWT once it's sent.
- JWT is a particularly useful technology for API authentication and server-to-server authorization

- The idea is simple: you get a secret token from the service when you set up the API:

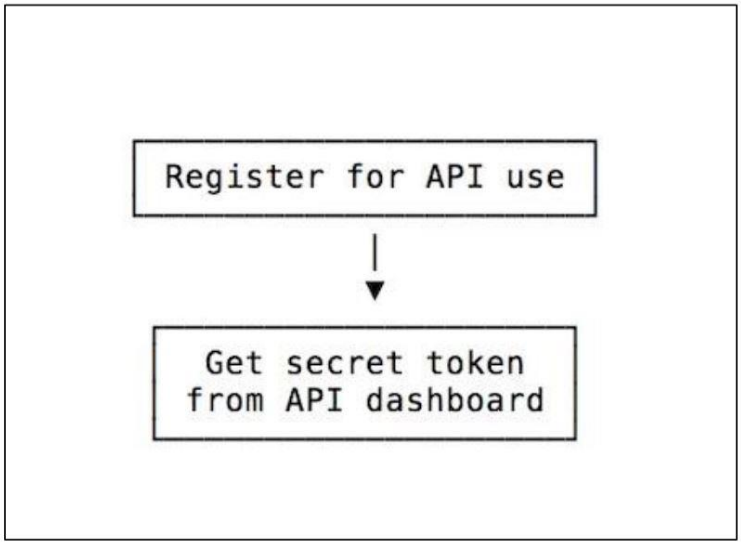

Figure 23: authentication process

Authorization:

To achieve Authorization, send token in header with all API to server

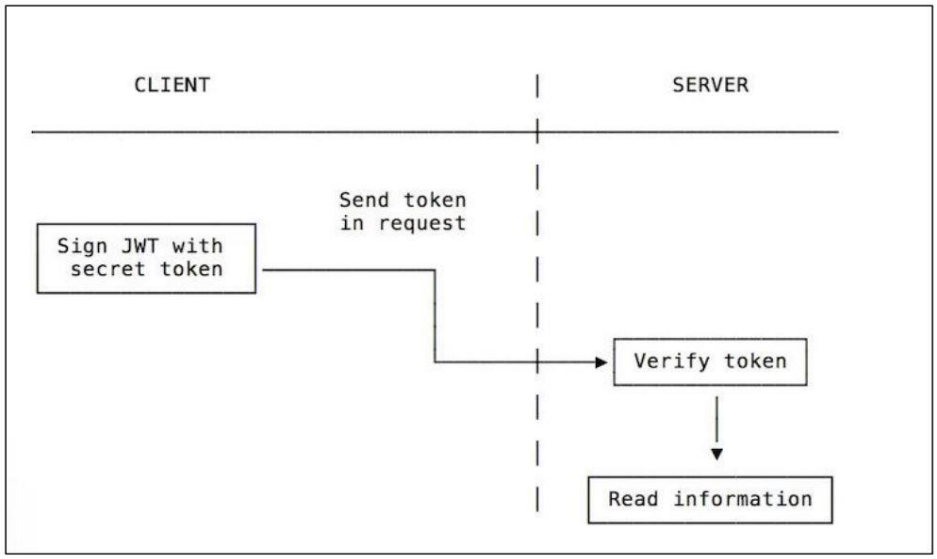

Figure 24: authentication process

Registration page

System has several users as like:

- **Admin:**

  This user can only be added from database, no one can add him.

- **Pharmacy:**
